

SecureStor™ Remote Backup Services

Safeguard your business critical data with SecureStor™ and never be left without a backup again.

Be the Hero - Protect Your Most Important Assets

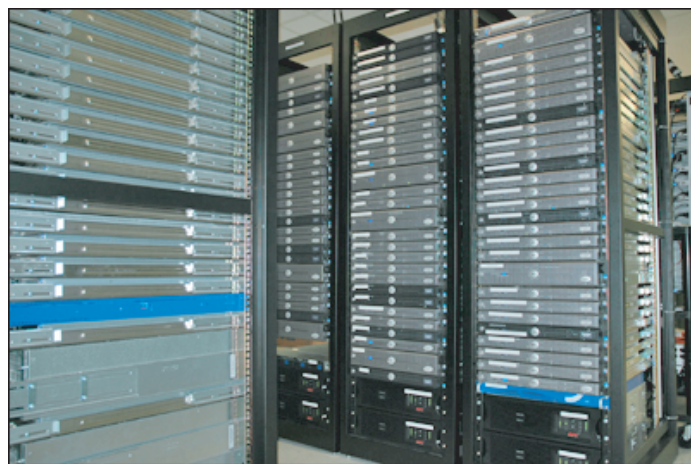

Imagine what would happen if your customer database, critical documents or Outlook .pst files were suddenly to disappear, go corrupt or your offices were struck by disaster? Without a means of recovery, the results would be catastrophic for any business. You can protect your critical assets and prevent this scenario by spending 10 minutes with SecureStor. You will never be without a backup again.

Set It and Forget It

You can configure SecureStor in less than 10 minutes and rest assured that your critical files are backed up to an ultra-secure Internet Data Center managed by Alentus. If and when needed, you can easily perform a restoration of your data back to your own workstation, laptop or network server. Alentus server administrators are NOT able in any way to view your encrypted files on the backup servers.

Automate Your Backup Strategy

Unlike free online data storage or file sharing services, SecureStor does not require an FTP client or web browser and time consuming manual steps to initiate a file transfer. Using SecureStor's built in scheduler, you can easily instruct the software to perform a nightly backup of your critical files, whether you are at your workstation or LAN server or not. SecureStor can even run as a background service and perform backups while you are working. With automated backups, you can help guarantee the secure storage of your most important digital assets.
